1 Introduction

The UMFT220XA is a development module for FTDI’s FT220XQ, one of the devices from FTDI’s range of USB interface bridging integrated circuit devices. FT220X is a USB to 4-bit SPI/FT1248 (only up to 4 bit wide) interface with a battery charger detection feature, which can allow batteries to be charged with a higher current from a dedicated charger port (without the FT220X being enumerated). In addition, asynchronous and synchronous bit bang interface modes are available. The internally generated clock (6MHz, 12MHz and 24MHz) can be brought out on the CBUS pin to be used to drive a microprocessor or external logic.

The UMFT220XA is a module which is designed to plug into a standard 0.3” wide 16 pin DIP socket. All components used, including the FT220XQ are Pb-free (RoHS compliant).

1.1 Features

The UMFT220XA is fitted with a FT220XQ; all the features of the FT220X can be utilized with the UMFT220XA. For a full list of the FT220X’s features please see the FT220X datasheet which can be found here. In addition to the features listed in the FT220X datasheet, the UMFT220XA has the following features:

- Small PCB assembly module designed to fit a standard 7.62mm (0.3”) wide 16 pin DIP socket. Pins are on a 2.54mm (0.1”) pitch.
- On board USB ‘mini-B’ socket allows module to be connected to a PC via a standard A to mini-B USB cable.
- Functionally configurable using solder links. The default solder links setup enables the module to function without peripheral wires or application board. Other configurations enable external power supply options and variation of logic reference levels.

2 Driver Support

Royalty-Free VIRTUAL COM PORT (VCP) DRIVERS for:
- Windows 7 32,64-bit
- Windows Vista
- Windows XP 32,64-bit
- Windows XP Embedded
- Windows CE.NET 4.2, 5.0 and 6.0
- MAC OS OS-X
- Linux 3.0 and greater
- Android

Royalty-Free D2XX Direct Drivers (USB Drivers + DLL S/W Interface):
- Windows 7 32,64-bit
- Windows Vista
- Windows XP 32,64-bit
- Windows XP Embedded
- Windows CE.NET 4.2, 5.0 and 6.0
- MAC OS OS-X
- Linux 3.0 and greater
- Android

The drivers listed above are all available to download for free from www.ftdichip.com. Various 3rd Party Drivers are also available for various other operating systems - visit www.ftdichip.com for details.

<td>Connects VBUS to VCC. This mode is known as “Bus Powered” mode.</td>
</tr>
<tr>
<td></td>
<td>Opened</td>
<td>Non-Default</td>
<td>Disconnects VBUS to VCC. This allows the supply of power from an external power supply. This mode is known as “Self-Powered” mode.</td>
</tr>
</tbody>
</table>

Table 5.2 – Solder Links JP2 Pin Description

Note: There should never be more than one power output supplied to the same net. Failure to properly remove solder from JP1 and JP2 can cause a direct short between two different power supplies (when a self-powered set-up is applied and the USB bus is connected) resulting in damage to the UMFT220XA module and the target circuit.

5.2 Solder Link Modifications

The UMFT220XA has two solder links fixed to the top side of the PCB. These solder link can be adjusted by removing the solder linking the two PADs to produce an open or by placing a solder blob to produce a short.

By default the UMFT220XA has both solder links shorting their pads. To allow for enhanced flexibility of this module remove both solder links and wire the header pins according to the power setup required.
5.3 BUS Powered Configuration

A bus powered configuration draws its power from the USB host/hub. The UMFT220XA is configured by default to be in bus powered mode.

Figure 5.1 illustrates the UMFT220XA module in a typical USB bus powered design configuration. By default solder bridge connections link VCCIO to 3V3OUT, and VCC to VBUS. (Note that Figure 5.1 is for illustration only and that the pins do not actually go all the way through the PCB)

For a bus power configuration power is supplied from the USB VBUS:

+5V VBUS power is sourced from the USB bus and is connected to the FT220X power input (VCC)
+3.3V power is sourced from the FT220X’s voltage regulator output and is connected to the FT220X IO port’s power input (VCCIO).

Interfacing the UMFT220XA module to a microcontroller (MCU), or other logic devices for bus powered configuration is done in exactly the same way as a self-powered configuration (see Section 5.3), except that it is possible for the MCU or external device to take its power supply from the USB bus (either the 5V from the USB pin, or 3.3V from the 3V3OUT pin).
5.4 Self Powered Configuration

A self-powered configuration operates on the principle of drawing power from an external power supply, as oppose to drawing power from the USB host. In this configuration no current is drawn from the USB bus.

Figure 5.2 illustrates the UMFT220XA in a typical USB self-powered configuration. In this case the solder links connection of JP1 is removed, which allows 5V power to be supplied to the module VCC pins from an external source. VCCIO can to be powered from 3V3OUT or the VCC of an external source. (Note that Figure 5.2 is for illustration only and that the pins do not actually go all the way through the PCB)

For a self-powered configuration it is necessary to prevent current from flowing back to the USB data lines when the connected USB host or hub has powered down. To carry out this function the UMFT220XA uses an on-board voltage divider network connected to the USB power bus and RESET# pin. This operates on the principle that when no power is supplied to the VBUS line, the FT220X will automatically be held in reset by a weak pull-down, when power is applied the voltage divider will apply a weak 3.3V pull-up. Driving a level to the RESET# pin of the UMFT220XA will override the effect of this voltage divider. When the FT220X is in reset the USB DP signal pull-up resistor connected to the data lines is disconnected and no current can flow down the USB lines.

An example of interfacing the FT220X with a Microcontroller’s FT1248 interface is also illustrated in Figure 5.2. This example shows the wire configuration of the transfer and handshake lines. This example also illustrates that a voltage other than 3.3V can be supplied to the FT220X’s IO port, this feature is described further and for bus powered mode in Section 5.6.

Alternatively both the FT220X’s IO port and MCU can be powered from the 3V3OUT pin; this approach is described in Section 5.5.
5.5 USB Bus Powered with Power Switching Configuration

USB bus powered mode is introduced in Section 5.3. This section describes how to use bus-powered mode with a power switch.

USB bus powered circuits are required by USB compliance standards to consume less than 2.5mA (and less than 100mA when not enumerated and not suspended) when connected to a host or hub when in USB suspend mode. The PWREN# CBUS function can be used to remove power from external circuitry whenever the FT220X is not enumerated. (Note: It is impossible to be in suspended mode when enumerated.) (Note that Figure 5.3 is for illustration only and that the pins do not actually go all the way through the PCB)

To implement a power switch using PWREN#, configure a P-Channel Power MOSFET to have a soft start by fitting a 10K pull-up, a 1K series resistor and a 100nF cap as shown in Figure 5.3.

Connecting the source of the P-Channel MOSFET to 3V3OUT instead of VBUS can allow external logic to source 3.3V power from the FT220X without breaking USB compliance. In this setup it is important that the VCCIO is not sourced from the drain of this MOSFET, this is because the power used to drive the gate of this transistor is sourced from VCCIO. VCCIO should be connected directly to 3V3OUT for this setup to function effectively. It is also important that the external logic must and IO core of the FT220X must not draw more that 50mA, this is because the current limit of the internal 3.3V regulator is 50mA.

Figure 5.3 – Bus Powered with Power Switching Configuration
5.6 Variable IO Voltage Supply

Vcc = 1.8V – 3.3V

Figure 5.4 – USB Bus Powered 3.3V Logic Drive

The FT220X can process signals at CMOS/TTL logic levels in the range of 1.8V to 3.3V. This section describes how to utilise this feature.

Figure 5.4 shows a configuration where the FT220X is interfaced to a device with IOs operating in the range of 1.8V - 3.3V. The IO ports of this module need to be powered with a voltage level that is equal to the level of the signals it is processing. Since the FT220X’s embedded voltage regulator only outputs 3V3 the IO ports will need to be powered from another power source when operating at voltage levels other than 3.3V.

By default, a short is present between 3V3OUT (embedded voltage regulator) and VCCIO (IO port’s power input) by solder links JP1. If an external power supply is used to power the IO ports this solder links needs to be open. This can be done by removing the solder linking the two pads of the solder links.

The configuration described in this section can be implemented in either bus-powered mode or self-powered mode.

Note 1: The CBUS and DBUS pins are 5V tolerant; however these signals cannot drive signals at 5V TTL/CMOS. VCCIO is not 5V tolerant; applying 5V to VCCIO will damage the chip.

Note 2: If power is applied to VCCIO and no power is applied to VCC all IOs will be at an unknown state, this however will not damage the chip. The FT220X also has protective circuitry to prevent the chip being damaged by a voltage discrepancy between VCCIO and the level of the signal being processed.

Note 3: When using VCCIO less than 3V3 on a chip from FTDI’s X-chip range, it is recommended to use pull up resistors (47K) to VCCIO on the data lines, all of the UMFT2xxXA-01 devices include an on-board pull-up for these lines.
5.7 3.3V Voltage Supply

The FT220X can be powered from a single 3.3V supply. This feature is an alternative to having the FT220X powered at 5V in standard self-powered configuration.

The 3.3V Self Powered configuration is illustrated in Figure 5.5. Note that the 3.3V net is connected to VCC, VCCIO and 3V3OUT.

(Note that Figure 5.5 is for illustration only and that the pins do not actually go all the way through the PCB)

5.8 Configuring the MTP ROM

When programming the MTP ROM please note:

i) One of the CBUS Pins can be configured as PWREN# in the internal MTP ROM. This can be used to switch the power supply to the external circuitry.

ii) The Max Bus Power setting of the MTP ROM should specify the maximum current to be drawn from the USB host/hub when enumerated. For high-powered USB devices the current limit when enumerated is between 100mA and 500mA, for low-powered USB devices the current limit is 100mA.
6 Module Dimensions

Figure 6.1 – UMFT220XA Module Dimensions

All dimensions are given in millimetres.
The UMFT220XA module exclusively uses lead free components, and is fully compliant with European Union directive 2002/95/EC.
Figure 7.1 – Module Circuit Schematic
8 Internal MTP ROM Configuration

Following a power-on reset or a USB reset the FT220X will scan its internal MTP ROM and read the USB configuration descriptors stored there. The default values programmed into the internal MTP ROM in the FT220XQ used on the UMFT220XA-01 and UMFT220XA-02 are shown in Table 8.1.

Appendix A - List of Figures and Tables

List of Figures

Figure 4.1 – Module Pin Out ............................................................................................................. 4
Figure 5.1 – Bus Powered Configuration ......................................................................................... 8
Figure 5.2 – Self-Powered Configuration ......................................................................................... 9
Figure 5.3 – Bus Powered with Power Switching Configuration ...................................................... 10
Figure 5.4 – USB Bus Powered 3.3V Logic Drive ............................................................................ 11
Figure 5.5 – USB Self Powered 3.3V Logic Drive ........................................................................... 12
Figure 6.1 – UMFT220XA Module Dimensions ............................................................................. 13
Figure 7.1 – Module Circuit Schematic .......................................................................................... 14

List of Tables

Table 4.1 – Module Pin Out Description .......................................................................................... 5
Table 4.2 – CBUS Signal Options .................................................................................................... 6
Table 5.1 – Solder Links JP1 Pin Description ................................................................................... 7
Table 5.2 – Solder Links JP2 Pin Description ................................................................................... 7
Table 8.1 – Default Internal MTP ROM Configuration ..................................................................... 15
Appendix B – Revision History

Document Title: UMFT220XA
Document Reference No.: FT_000517
Clearance No.: FTDI# 267
