1 Introduction

V2DIP1-32 module is designed to allow rapid development of designs using the VNC2-32Q IC. The V2DIP1-32 is supplied as a PCB designed to fit into a 24 pin 0.6” wide / 0.1” pitch DIP socket. The module provides access to the UART, parallel FIFO and SPI interface pins of the VNC2-32Q device via its IO bus pins. The USB port is accessed via a type A USB connector.

The VNC2 is the second of FTDI’s Vinculum family of Embedded dual USB host controller devices. The VNC2 device provides USB Host interfacing capability for a variety of different USB device classes including support for BOMS (bulk only mass storage), Printer, HID (human interface devices). For mass storage devices such as USB Flash drives, VNC2 also transparently handles the FAT file structure.

Communication with non USB devices such as a low cost microcontroller is accomplished via either UART, SPI or parallel FIFO interfaces. The VNC2 provides a new cost effective solution for providing USB Host capability into products that previously did not have the hardware resources available.

The VNC2 supports the capability to enable customers to develop custom firmware using the Vinculum II development software tool suite. The development tools support compiler, linker and debugger tools complete within an integrated development environment (IDE).

The Vinculum-II VNC2 family of devices are available in Pb-free (RoHS compliant) 32-lead LQFP, 32-lead QFN, 48-lead LQFP, 48-lead QFN, 64-Lead IQFP and 64-lead QFN packages.

2 Features

The V2DIP1-32 incorporates the following features:

- Uses FTDI’s VNC2-32Q embedded USB host controller IC device.
- USB ‘A’ type USB socket to interface with USB peripheral devices.
- Second USB interface port accessible via module pins if required.
- UART, parallel FIFO and SPI interfaces can be programmed to a choice of available I/O pins.
- Single 5V supply input from DIL connectors or 5V supplied via USB VBUS slave interface or debugger module.
- Auxiliary 3.3 V / 200 mA power output to external logic.

- All VNC2 signals available on 0.6” wide / 0.1” pitch DIL male connectors.
- Power and traffic indicator LED’s.
- V2DIP1-32 is a Pb-free, RoHS compliant development module.
- Debugger interface pin available on DIL pins or via 6 way male header which interfaces to separate debugger module.
- Firmware upgrades via UART or debugger interface pin header
- FOC software development suite of tools to create customised firmware includes a Compiler, Linker, Debugger and Assembler all wrapped up in an easy to use Integrated Design Environment GUI.
3 Pin Out and Signal Description

</tbody>
</table>

Table 3.2 - Default Interface I/O Pin Configuration
3.4 UART Interface

When the data and control buses are configured in UART mode, the interface implements a standard asynchronous serial UART port with flow control. The UART can support baud rates from 300 baud to 3Mbaud. The UART interface is described more fully in the VNC2 datasheet please refer to: [FTDI website]

3.4.1 Signal Description – UART Interface

The UART signals can be programmed to a choice of available I/O pins. Table 3.3 explains the available pins for each of the UART signals.

<table>
<thead>
<tr>

<td>uart_tx_active</td>
<td>Output</td>
<td>Enable Transmit Data for RS485 designs. TXDEN may be used to signal that a transmit operation is in progress. The TXDEN signal will be set high one bit-time before data is transmitted and return low one bit time after the last bit of a data frame has been transmitted</td>
</tr>
</tbody>
</table>

Table 3.3 - Data and Control Bus Signal Mode Options – UART
3.5 Serial Peripheral Interface (SPI)

The VNC2-32Q has one SPI master module and two SPI slave modules. These modules are described more fully in a VNC2 datasheet please refer to: [FTDI website](#).

### 3.5.1 Signal Description - SPI Slave

The SPI Slave signals can be programmed to a choice of available I/O pins. Table 3.4 explains the available pins for each of the SPI Slave signals.

<table>
<thead>
<tr>
<th>Available Pins</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>

<td>Output</td>
<td>Active low slave select 1 from master to slave 1</td>
</tr>
</tbody>
</table>

Table 3.5 - Data and Control Bus Signal Mode Options – SPI Master
3.6 Parallel FIFO Interface - Asynchronous Mode

The Parallel FIFO Asynchronous mode is functionally the same as the Parallel FIFO Interface available in VNC1L VDIP1 module and has an eight bit data bus, individual read and write strobes and two hardware flow control signals.

3.6.1 Signal Description - Parallel FIFO Interface

The Parallel FIFO Interface signals can be programmed to a choice of available I/O pins. Table 3.6 shows the Parallel FIFO Interface signals and the pins that they can be mapped.

<table>
<thead>
<tr>

</tbody>
</table>

Table 3.6 - Data and Control Bus Signal Mode Options – Parallel FIFO Interface
3.6.2 Timing Diagram – Asynchronous FIFO Mode Read and Write Cycle

When in Asynchronous FIFO interface mode, the timing of a read and write operation on the FIFO interface is shown in Table 3.7 and Figure 3.3.

**Read Timing**

- **t1**: RD# inactive to RXF#  
  - Min: 1  
  - Max: 14  
  - Unit: ns

- **t2**: RXF# inactive after RD# cycle  
  - Min: 100  
  - Max: -  
  - Unit: ns

- **t3**: RD# to Data  
  - Min: 1  
  - Max: 14  
  - Unit: ns

- **t4**: RD# active pulse width  
  - Min: 30  
  - Max: -  
  - Unit: ns

- **t5**: RD# active after RXF#  
  - Min: 0  
  - Max: -  
  - Unit: ns

- **t6**: WR# active to TXE# inactive  
  - Min: 1  
  - Max: 14  
  - Unit: ns

- **t7**: TXE# inactive after WR# cycle  
  - Min: 100  
  - Max: -  
  - Unit: ns

- **t8**: DATA to TXE# active setup time  
  - Min: 5  
  - Max: -  
  - Unit: ns

- **t9**: DATA hold time after WR# inactive  
  - Min: 5  
  - Max: -  
  - Unit: ns

- **t10**: WR# active pulse width  
  - Min: 30  
  - Max: -  
  - Unit: ns

- **t11**: WR# active after TXE#  
  - Min: 0  
  - Max: -  
  - Unit: ns

**Table 3.7 - Asynchronous FIFO Mode Read Cycle Timing**

In asynchronous mode an external device can control data transfer driving FIFO_WR# and FIFO_RD# inputs.

Current byte is available to be read when FIFO_RD# goes low. When FIFO_RD# goes high, FIFO_RXF# output will also go high. It will only become low again when there is another byte to read.

When FIFO_WR# goes low FIFO_TXE# flag will always go high. FIFO_TXE# goes low again only when there is still space for data to be written in to the module.
3.7 Debugger Interface

The purpose of the debugger interface is to provide access to the VNC2 silicon/firmware debugger. The debug interface can be accessed via the J2-10 pin on the DIL connector or, more easily, it can be accessed by connecting a VNC2_Debug_Module to the J3 connector. This debug module will give access to the debugger through a USB connection to a PC via the Integrated Development Environment (IDE). The IDE is a graphical interface to the VNC2 software development tool-chain and gives the following debug capabilities through the debugger interface:

- Flash Erase, Write and Program.
- Application debug - application code can have breakpoints, be single stepped and can be halted.
- Detailed internal debug - memory and register read/write access.

The Debugger Interface, and how to use it, is further described in the following applications Note Vinculum-II Debug Interface Description

3.7.1 Signal Description - Debugger Interface

Table 3.8 shows the signals and pins description for the Debugger Interface pin header J3

</tr>
</tbody>
</table>

Table 3.8 - Signal Name and Description – Debugger Interface
4 Firmware

4.1 Firmware Support

The VNC2 on the V2DIP1-32 can be programmed with the customers own firmware created using the Vinculum II firmware development tool chain or with various pre-compiled firmware profiles to allow a designer to easily change the functionality of the chip. Please refer to: - FTDI website for full details on available pre-compiled firmware

4.2 Available Firmware

V2DAP firmware is currently available: USB Host for single Flash Disk and general purpose USB peripherals. Selectable UART, FIFO or SPI interface command monitor. please refer to: - FTDI website for full details.

4.3 Firmware Upgrades

Refer to the debugger interface section which can be used to update the firmware.
5 External circuit Configuration

5.1 Adding a second USB Port

The external circuit configuration for adding second USB host port, with the USB activity LED, is shown below in Figure 5.1.

Distributor and Sales Representatives

Please visit the Sales Network page of the FTDI Web site for the contact details of our distributor(s) and sales representative(s) in your country.
Appendix A – References

Application and Technical Notes

Vinculum-II IO Cell Description
Vinculum-II Debug Interface Description
Vinculum-II IO Mux Explained
Vinculum-II PWM Example
Migrating Vinculum Designs From VNC1L to VNC2-48L1A
Vinculum-II Errata Technical Note
Appendix B – List of Figures and Tables

List of Figures

Figure 1.1 - V2DIP1-32 ............................................................................................................. 1
Figure 3.1 - V2DIP1-32 Module Pin Out (Top View) ............................................................... 4
Figure 3.2 - V2DIP1-32 Module Pin Out (Bottom View) ....................................................... 5
Figure 3.3 – Asynchronous FIFO Mode Read and Write Cycle. ............................................. 11
Figure 5.1 Additional USB Port Configuration ..................................................................... 14
Figure 6.1 - V2DIP1-32 Dimensions (Top View) .................................................................. 15
Figure 6.2 - V2DIP1-32 Dimensions (Side View) .................................................................. 15
Figure 7.1 - V2DIP1-32 Schematic.......................................................................................... 16

List of Tables

Table 3.1 - Pin Signal Descriptions ......................................................................................... 6
Table 3.2 - Default Interface I/O Pin Configuration ................................................................. 7
Table 3.3 - Data and Control Bus Signal Mode Options – UART .......................................... 8
Table 3.4 - Data and Control Bus Signal Mode Options – SPI Slave ...................................... 9
Table 3.5 - Data and Control Bus Signal Mode Options – SPI Master .................................... 9
Table 3.6 - Data and Control Bus Signal Mode Options – Parallel FIFO Interface ............... 10
Table 3.7 - Asynchronous FIFO Mode Read Cycle Timing .................................................... 11
Table 3.8 - Signal Name and Description – Debugger Interface .............................................. 12
## Appendix C – Revision History
