The intention of this errata technical note is to give a detailed description of any known functional or electrical issues with the FTDI FT232R devices. The current revision of the FT232R is revision B, released May 2007. At the time of releasing this Technical Note there are no known issues with this silicon revision.

1 FT232R Revision

FT232R part numbers are listed in Table 1. The letter at the end of date code identifies the device revision.

The current revision of the FT232R is revision B, released May 2007. At the time of releasing this Technical Note there are no known issues with this silicon revision.

</tr>
</tbody>
</table>
3 Functional Problems of FT232R

3.1 Revision A

3.1.1 PWREN# pulses during enumeration

Introduction:

PWREN# is an output to signal if the device is enumerated and awake (logic 0) or if it is in reset/suspend (logic 1)

Problem:

During enumeration the pins were configured as outputs and as a consequence of the 3 resets required during enumeration the device toggled 3 times giving a false indication that the device was ready to use.

Workaround:

There are no known workarounds available. This issue is corrected at silicon revision B.

Package specific:

The effected packages are listed in Table 3.

<table>
<thead>
<tr>
<th>Package</th>
<th>Applicable (Yes/No)</th>
</tr>
</thead>
<tbody>
<tr>
<td>FT232RL</td>
<td>Y</td>
</tr>
<tr>
<td>FT232RQ</td>
<td>Y</td>
</tr>
</tbody>
</table>

Table 3

3.1.2 BitBang Mode variable Pulse Width

Introduction:

BitBang is a mode the device may be put into to allow free running data to be clocked in/out of the device without any control bits.

Problem:

The output may be clocked out at different speeds to allow for different pulse widths. However this clocking stage is not synchronized with the incoming data and can result in the pulse widths varying unexpectedly on the output.

Workaround:

Set the clock divisor to 1 (baud rate = 3,000,000) and pad the data field with extra 1’s or 0’s to achieve the required pulse width for each bit.
Package specific:

The effected packages are listed in Table 4

<table>
<thead>
<tr>
<th>Package</th>
<th>Applicable (Yes/No)</th>
</tr>
</thead>
<tbody>
<tr>
<td>FT232RL</td>
<td>Y</td>
</tr>
<tr>
<td>FT232RQ</td>
<td>Y</td>
</tr>
</tbody>
</table>

Table 4

3.1 Revision B

There are no known new functional issues specific to revision B.
4 Electrical and Timing specification deviations of FT232R

4.1 Revision A

4.1.1 VCCIO cannot be set below 2.6V

Introduction:
The FT232R device is specified to handle IO down to 1.8V.

Problem:
The FT232R device contains an internal pullup (200k) on RESET#. This is wired to VCCIO and not VCC. If VCCIO is below 2.6V the device will not come out of reset.

Workaround:
There are no known workarounds available. This issue is corrected at silicon revision B.

Package specific:
The effected packages are listed in Table 5.

<table>
<thead>
<tr>
<th>Package</th>
<th>Applicable (Yes/No)</th>
</tr>
</thead>
<tbody>
<tr>
<td>FT232RL</td>
<td>Y</td>
</tr>
<tr>
<td>FT232RQ</td>
<td>Y</td>
</tr>
</tbody>
</table>

Table 5

4.1 Revision B

There are no known functional problems with revision B.
5 FT232R Package Markings

FT232R is available in two RoHS Compliant packages, 32 pin QFN and 28 pin SSOP. An example of the markings on each package is shown in

**Figure 5-1**

YYXX-A where YY is 2 digit year code, XX is 2 digit week code and -A is the revision

XXXXXXXXXXX is the manufacturing LOT code
